## NOTES

### 1. Coil operating power

Pure DC current should be applied to the coil. The wave form should be rectangular. If it includes ripple, the ripple factor should be less than 5%.

However, check it with the actual circuit since the characteristics may be slightly different. The nominal operating voltage should be applied to the coil for more than 20 ms to set/reset the latching type relay.

### 2. Coil connection

When connecting coils, refer to the wiring diagram to prevent mis-operation or malfunction.

### 3. External magnetic field

Since RJ relays are highly sensitive polarized relays, their characteristics will be affected by a strong external magnetic field. Avoid using the relay under that condition.

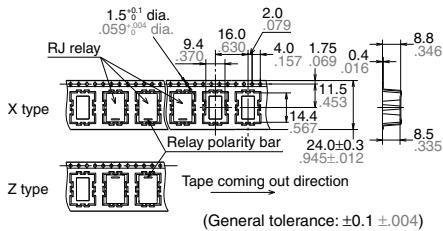

### 4. Cleaning

For automatic cleaning, the boiling method is recommended. Avoid ultrasonic cleaning which subjects the relays to high frequency vibrations, which may cause the contacts to stick.

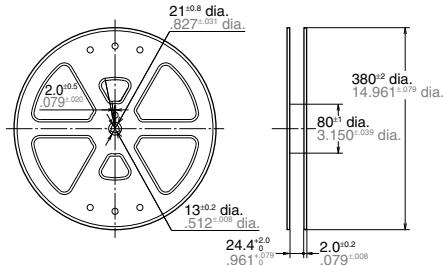

It is recommended that alcoholic solvents be used.

### 5. Tape and reel packing

#### 1) Tape dimensions

#### 2) Dimensions of plastic reel

### 6. Conditions for operation, transport and storage conditions

1) Ambient temperature, humidity, and atmospheric pressure during usage, transport, and storage of the relay:

#### (1) Temperature:

-30 to +70°C -22 to +158°F

(However, tolerance range is -30 to +60°C -22 to +140°F if package is carried as is.)

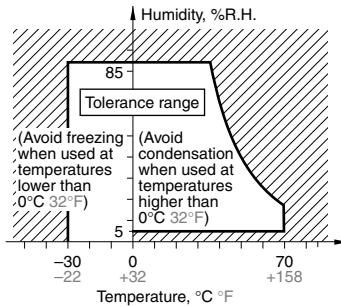

#### (2) Humidity: 5 to 85% RH

(Avoid freezing and condensation.)

The humidity range varies with the temperature. Use within the range indicated in the graph below.

#### (3) Atmospheric pressure: 86 to 106 kPa

Temperature and humidity range for usage, transport, and storage:

#### 2) Condensation

Condensation forms when there is a sudden change in temperature under high temperature and high humidity conditions. Condensation will cause deterioration of the relay insulation.

#### 3) Freezing

Condensation or other moisture may freeze on the relay when the temperature is lower than 0°C 32°F. This causes problems such as sticking of movable parts or operational time lags.

#### 4) Low temperature, low humidity environments

The plastic becomes brittle if the relay is exposed to a low temperature, low humidity environment for long periods of time.

#### 5) Storage procedures for surface-mount terminal types

Since the relay is very sensitive to humidity, it is packed in humidity-free, hermetically sealed packaging. When storing the relay, be careful of the following points:

- (1) Be sure to use the relay immediately after removing it from its sealed package.
- (2) When storing the relay for long periods of time after removing it from its sealed package, we recommend using a humidity-free bag with silica gel to prevent subjecting the relay to humidity. Furthermore, if the relay is solder mounted when it has been subjected to excessive humidity, cracks and leaks can

occur. Be sure to mount the relay under the required mounting conditions.

### 7. Soldering

#### 1) Surface-mount terminal

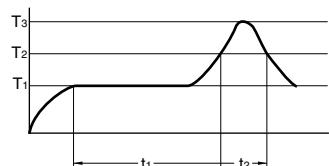

In case of automatic soldering, the following conditions should be observed

##### (1) Position of measuring temperature

Surface of PC board where relay is mounted.

##### (2) IR (infrared reflow) soldering method

$T_1 = 150 \text{ to } 180^\circ\text{C}$   $302 \text{ to } 356^\circ\text{F}$   
 $T_2 = 230^\circ\text{C}$   $446^\circ\text{F}$  and higher  
 $T_3 = \text{Within } 250^\circ\text{C}$   $482^\circ\text{F}$

Temperature rise of relay itself may vary according to the mounting level or the heating method of reflow equipment.

Therefore, please set the temperature of soldering portion of relay terminal and the top surface of the relay case not to exceed the above mentioned soldering condition.

It is recommended to check the temperature rise of each portion under actual mounting condition before use.

#### 2) Standard PC board terminal

Please meet the following conditions if this relay is to be automatically soldered.

- (1) Preheating: Max.  $120^\circ\text{C}$   $248^\circ\text{F}$  (terminal solder surface) for max. 120 seconds
- (2) Soldering: Max.  $260 \pm 5^\circ\text{C}$   $500 \pm 9^\circ\text{F}$  for max. 6 seconds

The effect on the relay depends on the actual substrate used. Please verify the substrate to be used.

Moisture-proof packaging enables RJ relay's standard PCB type capable for reflow soldering.

Please contact us in the case of reflow soldering considerations.

#### 3) Hand soldering

Please meet the following conditions if this relay is to be soldered by hand.

- (1) Wattage: 30 to 60 W
- (2) Tip temperature/time:  $280 \text{ to } 300^\circ\text{C}$   $536 \text{ to } 572^\circ\text{F}$  for max. 5 seconds

The effect on the relay depends on the actual substrate used. Please verify the substrate to be used.

- 4) Avoid high frequency cleaning since this may adversely affect relay characteristics. Use alcohol-based cleaning solutions when cleaning relays.
