Notes:

- a. Package limited.
- b. Surface Mounted on FR4 board.
- c. $t = 5 \text{ s}$.
- d. See Solder Profile (www.vishay.com/ppg?73257). The PowerPAK ChipFET is a leadless package. The end of the lead terminal is exposed copper (not plated) as a result of the singulation process in manufacturing. A solder fillet at the exposed copper tip cannot be guaranteed and is not required to ensure adequate bottom side solder interconnection.
- e. Rework Conditions: manual soldering with a soldering iron is not recommended for leadless components.
- f. Maximum under Steady State conditions for MOSFETS is $105 \text{ }^{\circ}\text{C}/\text{W}$.
- g. Maximum under Steady State conditions for Schottky is $110 \text{ }^{\circ}\text{C}/\text{W}$.

* The power dissipation P_D is based on $T_{J(\max)} = 150$ °C, using junction-to-case thermal resistance, and is more useful in settling the upper dissipation limit for cases where additional heatsinking is used. It is used to determine the current rating, when this rating falls below the package limit.
