Bi-CMOS IC

System Power Supply IC for Automotive Infotainment **Multiple Output Linear** Voltage Regulator

Overview

The LV5684NPVD is a multiple output linear regulator IC, which allows reduction of quiescent current. The LV5684NPVD is specifically designed to address automotive infotainment systems power supply requirements. The LV5684NPVD integrates 5 linear regulator outputs, 2 high side power switches, over-current limiter, overvoltage protection and thermal shut down. Supply for VDD and SW33V outputs is low voltage specification, which enables drastic reduction of power dissipation compared to the existing model.

Function

- Low consumption current: 50μA (typ, only V_{DD} output is in operation)
- 5 systems of regulator output

V_{DD} for microcontroller: output voltage: 3.3V,

maximum output current: 350mA.

For system: output voltage: 3.3V, maximum output current: 450mA

For audio: output voltage: 5 to 12V (set by external resistors),

maximum output current: 250mA

For illumination: output voltage: 5 to 12V (set by external resistors),

maximum output current: 300mA

For CD: output voltage: 5V/8V, maximum output current: 1300mA

- 2 lines of high side switch with current protection
 - EXT: Maximum output current: 350mA,

voltage difference between input and output: 0.5V

ANT: Maximum output current: 300mA,

voltage difference between input and output: 0.5V

- Supply input
 - V6IN: 6V for VDD, system (SW33V)
 - V_{CC}1: For internal reference voltage, control circuits

In case of voltage drop of V6IN, V_{CC}1 supplies to V_{DD} output.

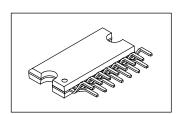

VCC2: For AUDIO, illumination, CD, EXT/ANT

- Over-current limiter
- Overvoltage protector(OVP): V_{CC}1,V_{CC}2 Typ 23V (All outputs except V_{DD} are turned off) Overvoltage shutdown(OVS): V6IN Typ 23V (All outputs except VDD are turned off)
- Thermal shut down: Typ 175°C

(Warning) The protector functions only improve the IC's tolerance and they do not guarantee the safety of the IC if used under the onditions out of safety range or ratings. Use of the IC such as use under overcurrent protection range, thermal shutdown state or V6IN OVS condition may degrade the IC's reliability and eventually damage the IC.

See detailed ordering and shipping information on page 15 of this data sheet.

HZIP15

Specifications

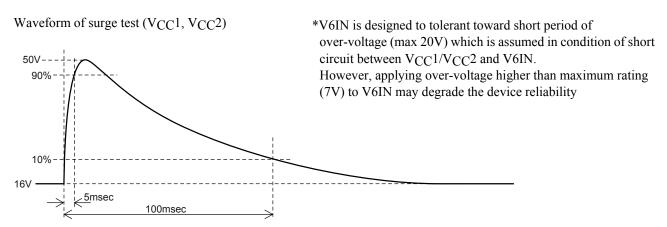

Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions		Conditions Ratings	
Supply voltage	V _{CC} max	V _{CC} 1, V _{CC} 2		36	V
	V6IN max	V6IN (*)		7	V
Input voltage	V _{IN} max	CTRL1, CTRL2		7	V
Allowable power dissipation	Pd max	Independent IC	Ta ≤ 25°C	1.3	W
		Al heat sink *		5.3	W
		With an infinity heat sink		26	W
Peak supply voltage	V _{CC} peak	See below for the waveform	applied.	50	V
Operating ambient temperature	Topr			-40 to +85	°C
Storage temperature	Tstg			-55 to +150	°C
Junction temperature	Tj max			150	°C

^{* :} When the Aluminum heat sink (50mm \times 50mm \times 1.5mm) is used

Caution 1) Absolute maximum ratings represent the value which cannot be exceeded for any length of time.

Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Recommended Operating Conditions at Ta = 25°C

VCC1

ACC1			
Parameter	Conditions	Ratings	Unit
Operating supply voltage 1	V _{DD} output	7 to 16	٧
V_{CC^2}			
Parameter	Conditions	Ratings	Unit
Operating supply voltage 2	ILM output (10V)	12 to 16	V
	ILM output (8V)	10 to 16	V
Operating supply voltage 3	AUDIO output (9V)	10 to 16	V
Operating supply voltage 4	CD output (I _O = 1.3A)	10.5 to 16	V
	CD output (I _O ≤ 1A)	10 to 16	V
Operating supply voltage 5	EXT output, ANT output	10 to 16	V
V6IN			
Parameter	Conditions	Ratings	Unit
Operating supply voltage 6	V _{DD} output, SW33V output	5.7 to 6.5	V

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

^{*1 :} All the specification is defined based on the tests performed under the conditions where Tj and Ta (= 25°C) are almost equal. These tests were performed with pulse load to minimize the increase of junction temperature (Tj).

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

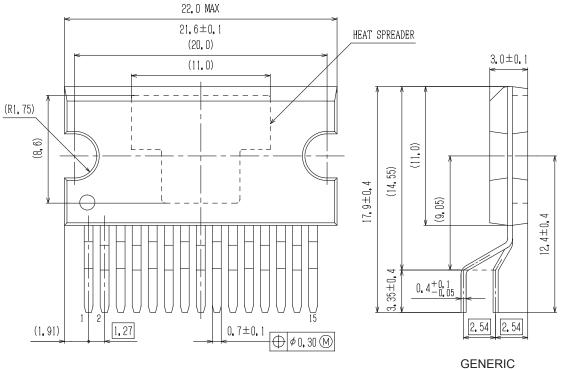

^{*2 :} guaranteed by design

^{*3 :} Using resistors of tolerance within 1%.

■Note for VDD output(PIN12) and V6IN (PIN11)

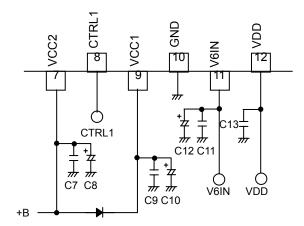

This product doesn't have reverse current prevention feature for the path of VDD to VCC1. As shown above equivalent circuit for PIN12, there exists a parasitic diode from VDD to VCC1. Accordingly if VCC1 voltage drops below approximately VDD-0.7V, reverse current flows from VDD to VCC1. If you need to prevent this current, insert a diode between VCC2 and VCC1 as shown on the figure below.

As the same manner, there is a parasitic diode from V6IN to VCC1.

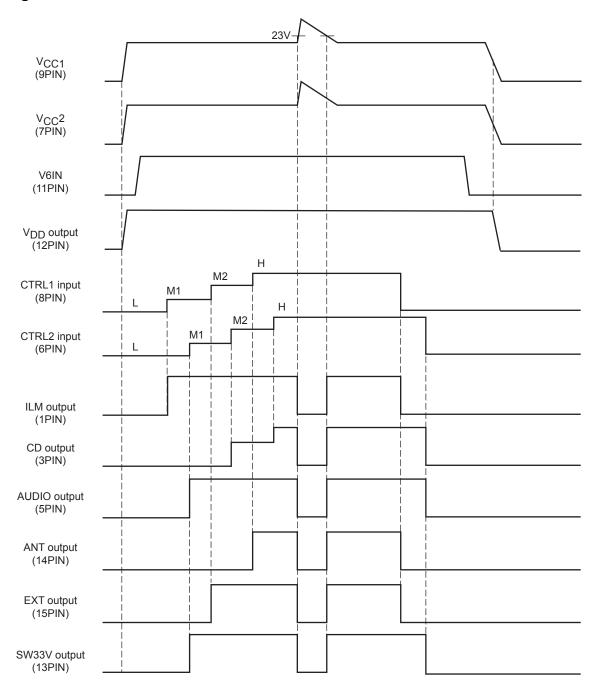

Do not apply voltage to these terminals so that these parasitic diodes are positively biased.

Use under the following condition.

 $VCC \ge VDD$, $VCC1 \ge V6IN$

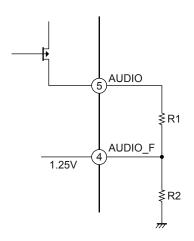

Timing Chart

Caution: The above values are obtained when typ.

· How to set AUDIO output voltage

AUDIO_F is determined by internal band-gap reference voltage (typ = 1.25V).

AUDIO output voltage expression

$$AUDIO = (\frac{R_1}{R_2} + 1) \times 1.25[V]$$

$$\frac{R_1}{R_2} = \frac{AUDIO}{1.25} - 1$$

Set the ratio of R1 and R2 to satisfy above expression.

(ex) AUDIO = 9V setting

$$\frac{R_1}{R_2} = \frac{9}{1.25} - 1 = 6.2$$

$$\frac{R_1}{R_2} = \frac{24k\Omega}{3.9k\Omega} \cong 6.15$$

$$\frac{R_1}{R_2} = \frac{24k\Omega}{3.9k\Omega} \approx 6.15$$

$$AUDIO = (6.15+1) \times 1.25V \approx 8.94V$$

• ILM output voltage is similarly calculated as AUDIO output.

(ex)
$$ILM = 10.5V$$
 setting

$$\frac{R_1}{R_2} = \frac{10.5}{1.25} - 1 = 7.4$$

$$\frac{R_1}{R_2} = \frac{56k\Omega}{7.5k\Omega} \cong 7.46$$

$$ILM = (7.46 + 1) \times 1.25V \cong 10.575V$$

Note: The above values are typical values. These values have variation among the range of their tolerances.

HZIP15 Heat sink attachment

Heat sinks are used to lower the semiconductor device junction temperature by leading the head generated by the device to the outer environment and dissipating that heat.

a. Unless otherwise specified, for power ICs with tabs and power ICs with attached heat sinks, solder must not be applied to the heat sink or tabs.

b. Heat sink attachment

- Use flat-head screws to attach heat sinks.
- Use also washer to protect the package.
- Use tightening torques in the ranges 39-59Ncm (4-6kgcm).
- If tapping screws are used, do not use screws with a diameter larger than the holes in the semiconductor device itself.
- Do not make gap, dust, or other contaminants to get between the semiconductor device and the tab or heat sink.
- Take care a position of via hole.
- Do not allow dirt, dust, or other contaminants to get between the semiconductor device and the tab or heat sink.
- Verify that there are no press burrs or screw-hole burrs on the heat sink.
- Warping in heat sinks and printed circuit boards must be no more than 0.05 mm between screw holes, for either concave or convex warping.
- Twisting must be limited to under 0.05 mm.
- Heat sink and semiconductor device are mounted in parallel.

 Take care of electric or compressed air drivers
- The speed of these torque wrenches should never exceed 700 rpm, and should typically be about 400 rpm.

Heat sink gap Via hole

X

0

c. Silicone grease

- Spread the silicone grease evenly when mounting heat sinks.
- Recommends YG-6260 (Momentive Performance Materials Japan LLC)

d. Mount

- First mount the heat sink on the semiconductor device, and then mount that assembly on the printed circuit board.
- When attaching a heat sink after mounting a semiconductor device into the printed circuit board, when tightening up a heat sink with the screw, the mechanical stress which is impossible to the semiconductor device and the pin doesn't hang.
- e. When mounting the semiconductor device to the heat sink using jigs, etc.,
 - Take care not to allow the device to ride onto the jig or positioning dowel.
 - Design the jig so that no unreasonable mechanical stress is applied to the semiconductor device.

f. Heat sink screw holes

- Be sure that chamfering and shear drop of heat sinks must not be larger than the diameter of screw head used.
- When using nuts, do not make the heat sink hole diameters larger than the diameter of the head of the screws used. A hole diameter about 15% larger than the diameter of the screw is desirable.
- When tap screws are used, be sure that the diameter of the holes in the heat sink are not too small. A diameter about 15% smaller than the diameter of the screw is desirable.
- g. There is a method to mount the semiconductor device to the heat sink by using a spring band. But this method is not recommended because of possible displacement due to fluctuation of the spring force with time or vibration.
