## Introduction

Designing power solutions for automotive applications requires special care of several conditions that are specific for automotive environment: The very wide operating temperature range, input voltage fluctuations and stringent requirements on EMI/noise generation due to the nearby car radio receiver. Therefore, automotive applications require high reliability and good safety protections. Richtek has launched robust automotive products and design tools that simplify the automotive power design considerably.

## Richtek Automotive Power Solutions

Richtek provides the wide range automotive solutions from DC/DC converters, LDOs, power switch, PMICs to LED drivers for the variety of automotive/industrial applications. Featuring input operating voltage up to 40V and output current up to 4A, Richtek automotive products with high performance and reliability in effectively thermal packages have successfully been selected by automotive manufacturers worldwide.

## Key Features of Richtek Automotive products

- Richtek offers both AEC-Q100 Grade 1, 2 & 3 qualified and automotive/industrial standard products for automotive applications. Based on AEC-Q100 guidelines, products which meet AEC-Q100 qualification are clearly designated in Richtek product datasheets and marked as Grade 3 operating from -40°C to 85°C, Grade 2 operating from -40°C to 105°C and Grade 1 operating from -40°C to 125°C.  
AEC-Q100 is a failure mechanism based stress test for automotive packaged integrated circuits. It was defined by major automotive manufacturers as a common part-qualification.

## Wide ranges of automotive power ICs from Richtek in different applications:

- Infotainment: Controller operating panel (HMI) and display, head-up display, head unit, Audio, Video, navigation (AVN) and others.
- Advanced Driver Assistance Systems: Multi-camera system with central processing (AVM), Ultrasonic parking assist, front long range radar, rear and front camera, and others.
- Others including Power Switch and LED lighting solutions.

## Automotive Design Considerations

Richtek automotive products are defined as two major categories for different applications: products with input voltage up to 40V and input voltage up to 5.5V.

- Products connected to the vehicle battery rails require 36V input voltage to support load dump and down to 4.5V for start-stop. The output voltages of systems normally range from 1.8V to 5V. In some cases such as cold-crank where battery rail can drop as low as 3V during cranking of the engine, it is not possible to maintain regulation when input voltage approaches the regulated voltage, and some voltage drop is allowed.
- Devices for vehicle interface processors in subsystems require input voltage up to 5.5V. The vehicle subsystem monitors temperature, voltage levels, etc.
- A radio receiver nearby has high sensitivity in electromagnetic fields in its operating bands, and will easily be affected by converter switch noise. Selecting a suitable switching frequency can help to avoid radiating noise in sensitive frequency bands. Richtek provides products with programmable switching frequency, which allows best trade-off between efficiency and component size. Some products with external clock synchronization can be set to avoid sensitive frequency bands and shift the second harmonic out of the tuned frequency band.
- Richtek also provides products with the low quiescent and low shutdown current, which is ideal for devices in standby mode.

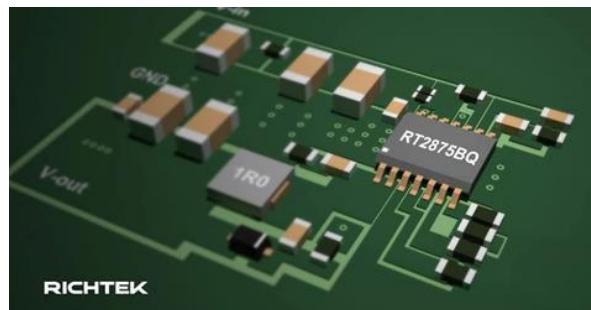

AEC-Q100 qualified	Buck converters	LDO	PMIC	LED Driver	<b>Others: Power Switch &amp; DDR termination regulator</b>
Up to 36V input	Grade 2 & 3	Grade 3	Grade 1	Grade 3	
Up to 5.5V input	Grade 3	Grade 3			Grade 1 & 3

## Component recommendations

### AEC-Q100 Solutions – up to 40V car battery input

Buck Converters									
	Part number	V <sub>IN</sub> (Min)	V <sub>IN</sub> (Max)	V <sub>out</sub> range	I <sub>OUT</sub>	f <sub>sw</sub> range	(T <sub>A</sub> ) Ambient temp. range	Key features	Package
